Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAZ91408 standard; cDNA; 4743 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    receptor DNA molecule. The p53-binding region, or a vector containing it, can be used to screen for apoptosis-modulating substances potentially useful for cancer chemotherapy. This sequence represents a fragment of the human CD95 receptor intron 1 which contains a p53 binding region described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ91408;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 266 BP; 49 A; 72 C; 110 G; 35 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes phosphorothioate antisense oligonucleotides that specifically hybridise with, and inhibit the expression of, nucleic acids encoding human Ship-2 (also called SH2-containing phosphatidylinositol phosphatase-2). Also described is a method of inhibiting the expression of Ship-2 in human cells or tissues in vitro comprising contacting the cells with the phosphorothioate antisense oligonucleotides. The phosphorothioate

                                                                                                                         The invention relates to human osteoclast expressed polynucleotide sequences (AAI68200-AAI68203) and the encoded proteins (AAMS1208-AAMS1211). The polynucleotides are useful as an index formaturation of osteoclasts.

                                                                                                                                                                                                                           Sequences AAS29770-AAS29813 represent cDNA molecules, which encode the cytoskeletal element-related polypeptides of the invention. Cytoskeletal cytoskeletal element-related polypurcleotides are useful in the characteristic cytoskeletal element-related polynucleotides are useful in the characteristic cytoskeletal polynucleotides are useful in the cytoskeletal polynucleotide. The treatment and prevention of various types of disorders in e.g. cytoskeletal polynucleotide. The treatment of a mutation in a cytoskeletal polynucleotide. The treatable cytoskeletal polynucleotide. The treatable cytoskeletal polynucleotide. The treatable cytoskeletal polynucleotide in the presence or absence of a mutation in a cytoskeletal polynucleotide. The treatable cytoskeletal polynucleotide cytoskeletal polynucleotide cytoskeletal polynucleotide such as cardiac arrest, cerebral cytoskeletal polynucleotide. The treatable cytoskeletal polynucleotide cytoskeletal poly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 5'-end of a cDNA provided in the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence was used as the representative sequence from a human clone which was used in homology searches to identify the clone.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                          17-JAN-2001; 2001WO-US01331.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytoskeletal element-related protein; human; mouse; rabbit;

A pathological condition can be determined by determining the presence or absence of a mutation in a cytoskeletal polynucleotide. The CC treatable disorders include autoimmune diseases such as rheumatoid CC arthritis, hyperproliferative disorders such as neoplasms of the breast CC or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, crivers such as labeliner's disease, infections caused by bacteria, CC viruses and fungi, ocular disorders such as corneal infection, endocrine CC disorders such as premature labour and infertility, gastrointestinal CC disorders such as premature labour and infertility, gastrointestinal CC disorders such as Crohn's disease, renal disorders such as corneating to prepare the constant of the sequence data for this patent did not form part of the printed CC specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                   The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                    17-NOV-2000;

                                                                                                The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                               830\ \mathrm{Primers} useful for synthesizing full length cDNA clones and their use in genetic manipulation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                08-JUL-1999; 99JP-0194486.

CC biological activities, such as cytokine, cell proliferation, or cellular cdifferentiation activities, tissue growth or regeneration, activin or comprehensive activity, chemotactic or chemokinetic activity, haemostatic or comprehensive activity, receptor/ligand activity, tumour inhibition, or comprehensive activity. The proteins can also be used as comprehensive activity. The proteins can be used as comprehensive activity activity. The proteins or cell types which expression. They comprehensive activity activity activity activity activity activity activity activity activity. The proteins can be used in protein interaction in protein expression. They can be used in protein interaction assays, to identify ligands or binding comprehens. Compounds which affect the biological activities of the proteins. Compounds which affect the biological activities of the comprehension of the proteins and comprehension of the protein assays. The proteins and comprehension of the protein activities of diseases which and the protein activities activities and the protein activities of diseases which activities activities and the protein activities of diseases which activities activities activities and the protein activities and the protein activities activities and the protein activities activities and activities and activities and activities activities and activities and activities activities and activities activities and activities activities activities and activities activit

The specification provides secreted protein sequences (AAW63691 to AAW63699) encoded by the nucleic acid sequences shown in AAV43611 to AAV43619. The invention provides a method of identifying a secreted polypeptide which is modified by rough microsomes. The secreted proteins can be used in assays to determine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Secreted human polypeptides - having cytokine, cell proliferation differentiation, activin or inhibin, tumour inhibition or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                          auxillary cytochrome P450 species 2A6. The gene encodes a protein of 494 amino acids. The cDNA was amplified by PCR using the primers AAQ87751-4. The product was cloned into the yeast expression vectors pAAH5N or pAHRR to produce the vectors p2A6 for the expression of the cytochrome P450 alone or p2A6R for co-expression with the yeast NADPH-P450 reductase. The vectors are used in a method for evaluating the safety of a chemical compound by reacting the chemical compound with recombinantly produced human cytochrome P450 molecular species IA2 (AAQ87714), 2C9 (AAQ87715), 2E1 (AAQ87716), or 3A4 (AAQ87717) or their auxillary species and variants (AAQ87718-32), and yeast NADPH-P450 reductase, either as a fused protein or in cell extracts, and analysing the resulting metabolite to assess the safety of the chemical compound. The method is useful for determining whether the chemical compound, or its metabolite, will be
                                              converted into a carcinogenic or mutagenic form through metabolism in the

The nucleotide sequence of the cDNA coding region for the human CC auxillary cytochrome P450 species 2A6 variant 1. The gene contains a CC change at base 1427 from A to C as compared to the wild type sequence CC (AAQ87721). This changes the amino acid residue from Arg to Lys. The cDNA CC cloned into the yeast expression vectors pAA68 variant 1 for the expression of the cytochrome P450 alone CC vectors p2A6 variant 1 for co-expression of the cytochrome P450 alone CC or p2A6R variant 1 for co-expression with the yeast NADPH-P450 CC a chemical compound by reacting the chemical compound with recombinantly CC (AAQ87715), 2E1 (AAQ87716), or 3A4 (AAQ87717) or their auxillary species and variants (AAQ87718-32), and yeast NADPH-P450 reductase, either as a fused protein or in cell extracts, and analysing the resulting metabolite to assess the safety of the chemical compound. The method is useful for determining whether the chemical compound, or its metabolite, will be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δð
